

## PostgreSQL - DATE/TIME Functions and Operators

We had discussed about the Date/Time data types in the chapter Data Types . Now, let us see the Date/Time operators and Functions.

The following table lists the behaviors of the basic arithmetic operators –

Operator	Example	Result
+	date '2001-09-28' + integer '7'	date '2001-10-05'
+	date '2001-09-28' + interval '1 hour'	timestamp '2001-09-28 01:00:00'
+	date '2001-09-28' + time '03:00'	timestamp '2001-09-28 03:00:00'
+	interval '1 day' + interval '1 hour'	interval '1 day 01:00:00'
+	timestamp '2001-09-28 01:00' + interval '23 hours'	timestamp '2001-09-29 00:00:00'
+	time '01:00' + interval '3 hours'	time '04:00:00'
-	- interval '23 hours'	interval '-23:00:00'
-	date '2001-10-01' - date '2001-09-28'	integer '3' (days)
-	date '2001-10-01' - integer '7'	date '2001-09-24'
-	date '2001-09-28' - interval '1 hour'	timestamp '2001-09-27 23:00:00'
-	time '05:00' - time '03:00'	interval '02:00:00'
-	time '05:00' - interval '2 hours'	time '03:00:00'
-	timestamp '2001-09-28 23:00' - interval '23 hours'	timestamp '2001-09-28 00:00:00'
-	interval '1 day' - interval '1 hour'	interval '1 day -01:00:00'
-	timestamp '2001-09-29 03:00' - timestamp '2001-09-27 12:00'	interval '1 day 15:00:00'
*	900 * interval '1 second'	interval '00:15:00'
*	21 * interval '1 day'	interval '21 days'
*	double precision '3.5' * interval '1 hour'	interval '03:30:00'
/	interval '1 hour' / double precision '1.5'	interval '00:40:00'

The following is the list of all important Date and Time related functions available.

S. No.	Function & Description
1	AGE() Subtract arguments
2	CURRENT DATE/TIME() Current date and time
3	DATE_PART() Get subfield (equivalent to extract)
4	EXTRACT() Get subfield
5	ISFINITE() Test for finite date, time and interval (not +/-infinity)
6	JUSTIFY Adjust interval

### AGE(timestamp, timestamp), AGE(timestamp)

S. No.	Function & Description
1	<b>AGE(timestamp, timestamp)</b>  When invoked with the TIMESTAMP form of the second argument, AGE() subtract arguments, producing a "symbolic" result that uses years and months and is of type INTERVAL.
2	<b>AGE(timestamp)</b>  When invoked with only the TIMESTAMP as argument, AGE() subtracts from the current_date (at midnight).

Example of the function AGE(timestamp, timestamp) is –

```
testdb=# SELECT AGE(timestamp '2001-04-10', timestamp '1957-06-13');
```

The above given PostgreSQL statement will produce the following result –

age
-----

```
43 years 9 mons 27 days
```

Example of the function AGE(timestamp) is –

```
testdb=# select age(timestamp '1957-06-13');
```

The above given PostgreSQL statement will produce the following result –

```
      age
-----
55 years 10 mons 22 days
```

## CURRENT DATE/TIME()

PostgreSQL provides a number of functions that return values related to the current date and time. Following are some functions –

S. No.	Function & Description
1	<b>CURRENT_DATE</b> Delivers current date.
2	<b>CURRENT_TIME</b> Delivers values with time zone.
3	<b>CURRENT_TIMESTAMP</b> Delivers values with time zone.
4	<b>CURRENT_TIME(precision)</b> Optionally takes a precision parameter, which causes the result to be rounded to that many fractional digits in the seconds field.
5	<b>CURRENT_TIMESTAMP(precision)</b> Optionally takes a precision parameter, which causes the result to be rounded to that many fractional digits in the seconds field.
6	<b>LOCALTIME</b> Delivers values without time zone.
7	<b>LOCALTIMESTAMP</b> Delivers values without time zone.
8	<b>LOCALTIME(precision)</b> Optionally takes a precision parameter, which causes the result to be rounded to that many fractional digits in the seconds field.
9	<b>LOCALTIMESTAMP(precision)</b> Optionally takes a precision parameter, which causes the result to be rounded to that many fractional digits in the seconds field.

Examples using the functions from the table above –

```
testdb=# SELECT CURRENT_TIME;
        timetz
```

-----

```
08:01:34.656+05:30
```

```
(1 row)
```

```
testdb=# SELECT CURRENT_DATE;  
         date
```

```
-----
```

```
2013-05-05
```

```
(1 row)
```

```
testdb=# SELECT CURRENT_TIMESTAMP;  
         now
```

```
-----
```

```
2013-05-05 08:01:45.375+05:30
```

```
(1 row)
```

```
testdb=# SELECT CURRENT_TIMESTAMP(2);  
         timestampz
```

```
-----
```

```
2013-05-05 08:01:50.89+05:30
```

```
(1 row)
```

```
testdb=# SELECT LOCALTIMESTAMP;  
         timestamp
```

```
-----
```

```
2013-05-05 08:01:55.75
```

```
(1 row)
```

PostgreSQL also provides functions that return the start time of the current statement, as well as the actual current time at the instant the function is called. These functions are –

S. No.	Function & Description
1	<b>transaction_timestamp()</b> It is equivalent to CURRENT_TIMESTAMP, but is named to clearly reflect what it returns.
2	<b>statement_timestamp()</b> It returns the start time of the current statement.
3	<b>clock_timestamp()</b> It returns the actual current time, and therefore its value changes even within a single SQL command.
4	<b>timeofday()</b> It returns the actual current time, but as a formatted text string rather than a timestamp with time zone value.
5	<b>now()</b> It is a traditional PostgreSQL equivalent to transaction_timestamp().

**DATE\_PART(text, timestamp), DATE\_PART(text, interval), DATE\_TRUNC(text, timestamp)**

S. No.	Function & Description
1	<p><b>DATE_PART('field', source)</b></p> <p>These functions get the subfields. The <i>field</i> parameter needs to be a string value, not a name.</p> <p>The valid field names are: <i>century, day, decade, dow, doy, epoch, hour, isodow, isoyear, microseconds, millennium, milliseconds, minute, month, quarter, second, timezone, timezone_hour, timezone_minute, week, year.</i></p>
2	<p><b>DATE_TRUNC('field', source)</b></p> <p>This function is conceptually similar to the <i>trunc</i> function for numbers. <i>source</i> is a value expression of type timestamp or interval. <i>field</i> selects to which precision to truncate the input value. The return value is of type <i>timestamp</i> or <i>interval</i>.</p> <p>The valid values for <i>field</i> are : <i>microseconds, milliseconds, second, minute, hour, day, week, month, quarter, year, decade, century, millennium</i></p>

The following are examples for DATE\_PART('field', source) functions –

```
testdb=# SELECT date_part('day', TIMESTAMP '2001-02-16 20:38:40');
date_part
-----
         16
(1 row)
```

```
testdb=# SELECT date_part('hour', INTERVAL '4 hours 3 minutes');
date_part
-----
         4
(1 row)
```

The following are examples for DATE\_TRUNC('field', source) functions –

```
testdb=# SELECT date_trunc('hour', TIMESTAMP '2001-02-16 20:38:40');
date_trunc
-----
2001-02-16 20:00:00
(1 row)
```

```
testdb=# SELECT date_trunc('year', TIMESTAMP '2001-02-16 20:38:40');
date_trunc
-----
2001-01-01 00:00:00
(1 row)
```

## EXTRACT(field from timestamp), EXTRACT(field from interval)

The **EXTRACT(field FROM source)** function retrieves subfields such as year or hour from date/time values. The *source* must be a value expression of type *timestamp*, *time*, or *interval*. The *field* is an identifier or string that selects what field to extract from the source value. The EXTRACT function returns values of type *double precision*.

The following are valid field names (similar to DATE\_PART function field names): century, day, decade, dow, doy, epoch, hour, isodow, isoyear, microseconds, millennium, milliseconds, minute, month, quarter, second, timezone, timezone\_hour, timezone\_minute, week, year.

The following are examples of EXTRACT(*field*, source) functions –

```
testdb=# SELECT EXTRACT(CENTURY FROM TIMESTAMP '2000-12-16 12:21:13');
date_part
-----
          20
(1 row)
```

```
testdb=# SELECT EXTRACT(DAY FROM TIMESTAMP '2001-02-16 20:38:40');
date_part
-----
          16
(1 row)
```

## ISFINITE(date), ISFINITE(timestamp), ISFINITE(interval)

S. No.	Function & Description
1	<b>ISFINITE(date)</b> Tests for finite date.
2	<b>ISFINITE(timestamp)</b> Tests for finite time stamp.
3	<b>ISFINITE(interval)</b> Tests for finite interval.

The following are the examples of the ISFINITE() functions –

```
testdb=# SELECT isfinite(date '2001-02-16');
isfinite
-----
t
```

```
(1 row)
```

```
testdb=# SELECT isfinite(timestamp '2001-02-16 21:28:30');
isfinite
```

```
-----
```

```
t
```

```
(1 row)
```

```
testdb=# SELECT isfinite(interval '4 hours');
isfinite
```

```
-----
```

```
t
```

```
(1 row)
```

## JUSTIFY\_DAYS(interval), JUSTIFY\_HOURS(interval), JUSTIFY\_INTERVAL(interval)

S. No.	Function & Description
1	<b>JUSTIFY_DAYS(interval)</b> Adjusts interval so 30-day time periods are represented as months. Return the <b>interval</b> type
2	<b>JUSTIFY_HOURS(interval)</b> Adjusts interval so 24-hour time periods are represented as days. Return the <b>interval</b> type
3	<b>JUSTIFY_INTERVAL(interval)</b> Adjusts interval using JUSTIFY_DAYS and JUSTIFY_HOURS, with additional sign adjustments. Return the <b>interval</b> type

The following are the examples for the ISFINITE() functions –

```
testdb=# SELECT justify_days(interval '35 days');
justify_days
```

```
-----
```

```
1 mon 5 days
```

```
(1 row)
```

```
testdb=# SELECT justify_hours(interval '27 hours');
justify_hours
```

```
-----  
1 day 03:00:00  
(1 row)
```

```
testdb=# SELECT justify_interval(interval '1 mon -1 hour');  
justify_interval
```

```
-----  
29 days 23:00:00  
(1 row)
```
